

# KATE2025 Ecotoxicity Prediction System

## Technical Document (Ver. 2025/03/27)

- ※ KATE2025 is a system to predict the following ecotoxicity of organic chemicals:
- 50% lethal concentration (LC<sub>50</sub>) in the fish acute toxicity test
  - 50% effective concentration (EC<sub>50</sub>) in the *Daphnia magna* acute immobilization test
  - 50% effective concentration (EC<sub>50</sub>) in the algal growth inhibition test
  - No-observed-effect concentration (NOEC) in the fish early-life-stage toxicity test
  - No-observed-effect concentration (NOEC) in the *Daphnia magna* reproduction test
  - No-observed-effect concentration (NOEC) in the algal growth inhibition test

\* Values predicted by KATE2025 cannot be used to satisfy the requirements for reporting ecotoxicity tests under the Law Concerning Examination of Chemical Substances and Regulation of Manufacturing, etc.

\*Please use the predicted values as reference values for ecotoxicological effects of chemical substances.

Enquiries should be directed to the email address indicated below.

## List of abbreviations

### CDK: Chemistry Development Kit

A collection of free and open-source Java libraries for processing cheminformatics and bioinformatics. The kit can be used to search for the substructures of chemical substances and calculate their structures and physical properties[1].

### EC<sub>50</sub>: 50% Effective Concentration

The concentration of a substance dissolved in test water expected to produce a certain effect in 50% of test organisms in a given population under a defined set of conditions.

### KATE: KAshinhou Tool for Ecotoxicity

The ecotoxicity QSAR system researched and developed by the Health and Environmental Risk Division of the National Institute for Environmental Studies. It is pronounced as in the feminine name Kate.

### KOWWIN™:

A program to estimate log P values of organic compounds included in the EPI Suite™ (Estimation Programs Interface: a tool intended for use in applications such as to quickly screen chemicals) developed by the U.S. EPA and its partners[2].

### LC<sub>50</sub>: 50% Lethal Concentration

The concentration of a substance dissolved in test water which, based on laboratory tests, is expected to kill 50% of a group of test species when administered as a single exposure.

### log P: Logarithm of the octanol/water partition coefficient

A common logarithm of the ratio of concentrations of a chemical substance between 1-octanol and water in equilibrium. It represents the hydrophobicity of a chemical substance and does not account for ionization of the chemical substance in question[3].

### NOEC: No Observed Effect Concentration

The highest tested concentration (also called maximum no-effect concentration) for which there is no statistically significant difference of effect ( $p < 0.05$ ) when compared to the control group. This concentration range is just below the LOEC (Least Observed Effect

Concentration) (reference: Japanese Ministry of the Environment, Environmental Risk Assessment of Chemical Substances Vol. 17, Chapter 1, Reference 2 Glossary [4])

OECD: Organisation for Economic Co-operation and Development

(Q) SAR: (Quantitative) Structure–Activity Relationships

The relationship between the structural characteristics or the physicochemical constant of a chemical substance and its biological activities (e.g., toxicity) is called the Structure–Activity Relationship (SAR), while the quantitative relationship is called the Quantitative Structure–Activity Relationship (QSAR). Both may be referred to collectively as (Q)SAR. SAR refers to, for example, an estimation of the toxicity level of a chemical based on the presence of a specific functional group. A model to quantitatively calculate the toxicity or other properties of a chemical based on the structure is called a QSAR model. (reference: Japanese Ministry of the Environment, Environmental Risk Assessment of Chemical Substances Vol. 17, Chapter 1, Reference 2 Glossary [4])

SMARTS: SMiles ARbitrary Target Specification

An identifier extended from SMILES to describe substructures.[5]

SMILES: Simplified Molecular Input Line Entry System

An identifier of line notation with printable characters to describe the molecular structures, etc., of chemical compounds.[6]

U.S. EPA: United States Environmental Protection Agency

## 1. Introduction

### 1.1 KATE (KAshinhou Tool for Ecotoxicity) System

KATE ([kate.nies.go.jp](http://kate.nies.go.jp)) is an ecotoxicity QSAR system for which research and development was commissioned by the Japanese Ministry of the Environment (MoE) to the Health and Environmental Risk Division of the National Institute for Environmental Studies. KATE is a system to predict ecotoxicity based on the structure of chemical substances. The ecotoxicity values predicted by KATE2025 are as follows:

- 50% lethal concentration (LC<sub>50</sub>) in acute toxicity test for fish (OECD TG 203)[7]
- No-observed-effect concentration (NOEC) in fish early-life-stage toxicity test (OECD TG 210)
- 50% effective concentration (EC<sub>50</sub>) in the *Daphnia magna* acute immobilization test (OECD TG 202)[9]
- No-observed-effect concentration (NOEC) in the *Daphnia magna* reproduction test (OECD TG 211)[10]
- 50% effective concentration (EC<sub>50</sub>) and no-observed-effect concentration (NOEC) in the algal growth inhibition test (OECD TG 201)[11]
- 

Data is entered using SMILES notation, which can be obtained by CAS number search, or drawing using a chemical structure editor, in order to carry out a QSAR prediction by using a regression equation with log P as a descriptor.

The QSAR model of KATE2025 was constructed using ecotoxicity data obtained from aquatic toxicity tests conducted by the Japan MoE[12] (fish acute toxicity test, *Daphnia magna* acute immobilisation test, fish early-life-stage toxicity test, *Daphnia magna* reproduction test, and algal growth inhibition test), together with fish acute toxicity data from the U.S. EPA's fathead minnow database[13].

### 1.2 Purpose of KATE 2025 Technical Document

This technical document explains the derivation of the KATE2025 QSAR model and its performance evaluation based on OECD QSAR validation principles[14]. Its target reader is those who have experience using KATE2025.

Please refer to the KATE2025 Operation Manual

([https://kate.nies.go.jp/doc/KATE2025\\_manual-en.pdf](https://kate.nies.go.jp/doc/KATE2025_manual-en.pdf)) for instructions on using

KATE2025, its development history, and its update history.

### 1.3 OECD QSAR Validation Principles

The technical document describes the KATE2025 QSAR model in terms of the five OECD QSAR validation principles[14].

The QSAR model must satisfy the five OECD QSAR validation principles in order to ensure validity and reliability when applying the model to chemical substance regulations.

They are as follows:

1. Endpoint definition
2. Unambiguous algorithms
3. Defined domain of applicability
4. Appropriate assessment of goodness-of-fit, robustness and predictivity
5. If possible, explanation of mechanism

### 1.4 log P

KATE2025 utilizes the log P estimation model KOWWIN<sup>TM</sup>[5] copyrighted by the U.S. EPA, with its permission, in order to obtain log P values used for predicting the toxicity of chemical substances.

Users must comply with the KOWWIN<sup>TM</sup> licensing terms described below.

KOWWIN v1.69 (April 2015)

© 2000-2015 U.S. Environmental Protection Agency

KOWWIN is owned by the U.S. Environmental Protection Agency and is protected by copyright throughout the world.

Permission is granted for individuals to download and use the software on their personal and business computers.

Users may not alter, modify, merge, adapt or prepare derivative works from the software. Users may not remove or obscure copyright, tradename, or proprietary notices on the program or related documentation.

KOWWIN contained therein is a tradename owned by the U.S. Environmental Protection Agency.

## 1.5 Disclaimer

The accuracy of results predicted by the KATE is not guaranteed. Please utilize this system as a tool to obtain reference information on the degree of ecotoxicological effects of chemical substances. The Ministry of the Environment and the National Institute for Environmental Studies do not guarantee the predicted ecotoxicity values provided by KATE and assume no responsibility whatsoever for any damage resulting from the use of ecotoxicity values predicted by KATE.

Further, values predicted by this system cannot currently be used to satisfy the requirements for reporting ecotoxicity tests under the Japanese Law Concerning Examination of Chemical Substances and Regulation of Manufacturing, etc.

For copyright information and instructions for linking to the site, please visit the Website Policy page on the KATE website (<https://kate.nies.go.jp/spolicy-en.html>).

## 1.6 Acknowledgements

KATE2025 uses results obtained from the following software and libraries. Here, we express appreciation to all who developed them.

- Open Babel[15]
- JSME Molecular Editor[16, 17]
- CDK (Chemistry Development Kit)[1, 18–21]
- KOWWIN<sup>TM</sup> (included in EPI Suite<sup>TM</sup>)[2]

## 2. Endpoint Definition – OECD (Q) SAR Validation Principle 1

Here, we define the endpoints predicted by KATE2025.

### 2.1 Endpoints Predicted by KATE2025

KATE2025 predicts acute and chronic toxicities regarding the endpoints (toxicity indicators) shown in table 2-1.

Table 2-1: Endpoints predicted by KATE2025

Predicted Toxicity Type		Species (Scientific Name)	Testing Method	Duration	Indicator
Organism	Acute/ Chronic				
Fish	Acute	<i>Oryzias latipes</i> , <i>Pimephales promelas</i> *1	Fish acute toxicity test (OECD TG 203) [7]	96 h	LC <sub>50</sub>
Daphnid	Acute	<i>Daphnia magna</i>	Daphnia magna immobilization test (OECD TG 202) [9]	48 h	EC <sub>50</sub>
Alga	Acute	<i>Raphidocelis subcapitata</i> *2	Algal growth inhibition test (OECD TG 201) [11]	72 h	EC <sub>50</sub>
Fish	Chronic	<i>Oryzias latipes</i>	Fish early-life-stage toxicity test (OECD TG 210) [8]	Embryonic stage and 30 days after hatching*3	NOEC
Daphnid	Chronic	<i>Daphnia magna</i>	Daphnia magna reproduction test (OECD TG 211) [10]	21 d	NOEC
Alga	Chronic	<i>Raphidocelis subcapitata</i> *2	Algal growth inhibition test (OECD TG 201) [11]	72 h	NOEC

\*1 If toxicity values are available for one chemical from both *Oryzias latipes* (Japanese medaka) data and *Pimephales promelas* (fathead minnow) data, the Japanese medaka data is used. When KATE was initially developed, Japanese medaka data tested by MoE alone were insufficient in terms of the number of substances to build a prediction model with sufficient precision. Therefore, U.S. EPA fathead minnow test data were also employed and interspecies differences between Japanese medaka and fathead minnow were investigated. The findings confirmed that by building QSAR equations using fathead minnow data as well, higher precision could be obtained compared to using Japanese medaka data alone. Furthermore, for substances for which measured toxicity values for both Japanese medaka and fathead minnow could be obtained, the only one substance for which the values differed by more than a factor of ten was dimethylamine (Studies on Regulatory based Assessment of Chemicals under Japanese Chemical Law, Fiscal 2009 Edition).

\*2 May have been referred to previously as *Selenastrum capricornutum* or *Pseudokirchneriella subcapitata*, etc.

\*3 Test durations for fish species early-life stage tests differ depending on the type of fish and incubation period. In the case of Japanese medaka used in aquatic toxicity tests conducted by the MoE, the test duration from the embryo stage to 30 days post-hatch is used.

## 2.2 Predicted Value Units

KATE2025 outputs predicted values for toxicity indicators in units of mg/L.

## 2.3 Dependent Variable

KATE2025 uses the log of the reciprocal, i.e.,  $\log(1/\text{toxicity value}[\text{mmol/L}])$  as the dependent variable converted from units of mg/L.

## 2.4 Data

The toxicity data used in KATE2025 are based on the results of aquatic toxicity tests carried out by the Japan MoE [12] (fish acute toxicity test, *Daphnia magna* acute immobilisation test, fish early-life stage toxicity test, *Daphnia magna* reproduction test, algal growth inhibition test), and U.S. EPA's fathead minnow acute toxicity test results [13]. Table 2-2 lists the number of substances in KATE2025 for each predicted toxicity type.

Table 2-2: Number of substances for each predicted toxicity type

		Acute			Chronic		
		Fish	Daphnid	Alga	Fish	Daphnid	Alga
Data used in regression	MoE Data	360	436	316	32	312	402
	US EPA Data	497					
Support Chemical*1	MoE Data	205	134	207	1	60	115
	US EPA Data	1					
Chemical not classified into any of QSAR classes of KATE2025*2	MoE Data	8	16	31	0	12	19
	US EPA Data	8					
Total		1079	486	487	33	384	534

\*1 Data with inequality sign (limit tests etc.), mixtures and substances for which log P is greater than 6.0 that are not used to build regression equation of QSAR class. Log P values estimated by KOWWIN™ are used for all substances.

\*2 Substances that do not correspond to any KATE2025 QSAR class are designated as "Unclassified class" when predictions are being made, and no predictions are done.

### 3. Algorithm – OECD (Q)SAR Validation Principle 2

Here, we describe the KATE2025 algorithm. Section 3.1 presents an outline, and the subsequent sections go into more detail.

#### 3.1 Algorithm Outline

KATE2025 is a linear regression-based QSAR model that predicts the toxicity of chemical substances (organic compounds). The bio membrane permeability, their bioaccumulation, and toxicity of chemical substances are thought to be correlated and based on this assumption, log P is used as a descriptor.

The Japanese MoE's aquatic toxicity test data and the U.S. EPA's fathead minnow acute toxicity test data are used as training set data. Classification is carried out based on a decision tree with the features of the types and number of substructures contained in each substance.

KATE2025 has 19 major categories and the other categories as shown in Table 3–1. Each category has a characteristic substructure, and substances are also categorized into reactive and unreactive classes based on the presence or absence of substructures considered to be highly reactive and highly toxic. Further conditional branches (presence of halogens, presence of aromatic atoms, etc.) are used for segmentation of structure classes (refer to Chapter 3, Section 3.5). QSAR classes (refer to Chapter 3, Section 3.6) classes are assigned to structure classes and regression equation is built for each QSAR class. Some QSAR classes are classified as being specific for the toxicity prediction to specific groups of organisms. Substances possessing substructures with low reactivity that only exhibit narcotic effects are categorized as the narcotic group class. Substructures exhibiting specific effects such as skin sensitization[22] are primarily used to evaluate the applicability domain of structures (refer to Chapter 4, Section 4.2 A)[23], although some of those are used for classification.

Information of the structure of query chemicals are entered using the alphanumeric SMILES notation[6], and substructure/s and their number/s are obtained using the CDK cheminformatics tool CDK[1]. Substructures are predefined using SMARTS notation[5], which is an extended notation of SMILES. QSAR Class assignment is done according to extracted substructures based on the aforementioned decision tree. Multiple classes may be assigned per predicted toxicity type (if the query chemical contains substructures that do not match any classes existing in KATE2025, the chemical is assigned to Unclassified class and toxicities are not predicted). Subsequently, the predicted toxicity value for each class is generated based on log P value estimated by KOWWIN™[2]. While the log P value can be manually entered by the user, log P values

estimated by KOWWIN™ are used for all chemical data in QSAR classes of KATE2025. Furthermore, applicability domains for structure and log P are judged for each QSAR class.

Table 3–1: KATE2025 Major Classification List

	Classification Category	Substructure ID	Substructure Name	SMARTS

			.	

The toxicity prediction flow is shown below (refer to Figure 3-1).

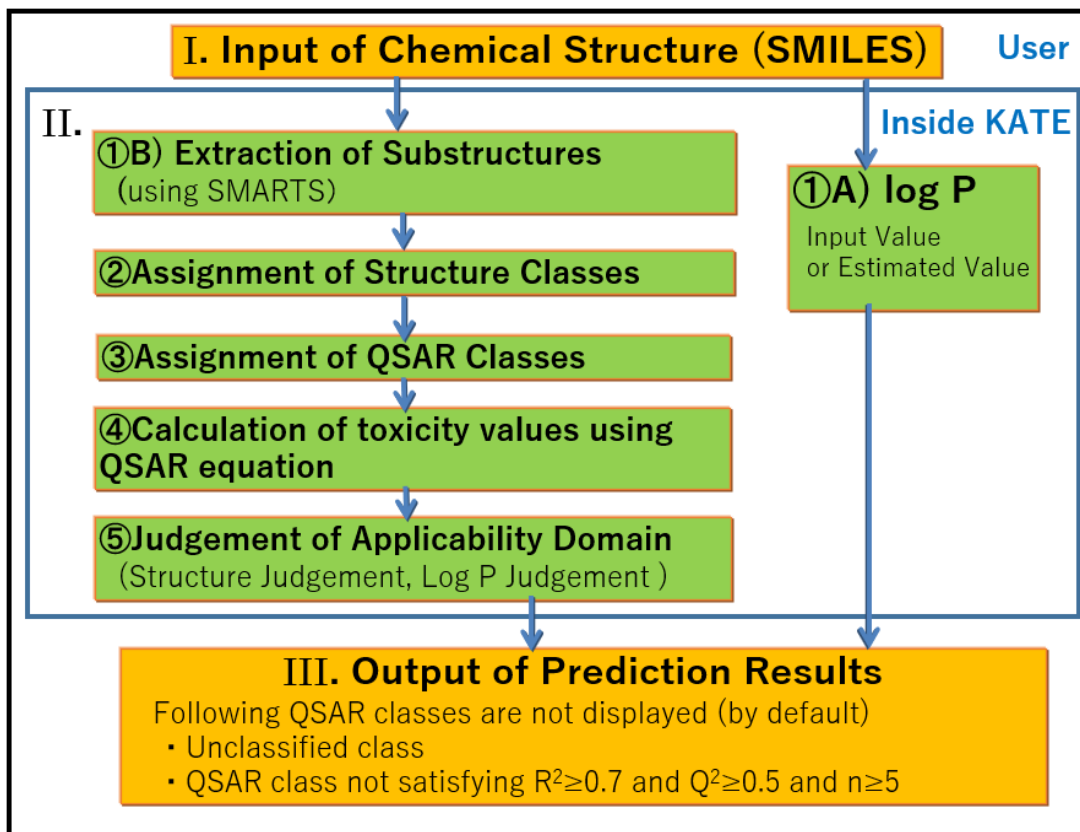

Figure 3-1 KATE2025 toxicity prediction flow

- I . The user inputs the structure of the chemical substance (using SMILES notation) and the log P value (optional).
- II. Processes on the QSAR equation assignment, predicted toxicity values, and the applicability domain judgement.
  - ① For the query chemical (entered chemical substance)
    - A) log P value is estimated (or the input value is used).
    - B) substructure/s is/are extracted.
  - ② Structure class<sup>\*1</sup> is assigned based on the types and numbers of the extracted substructures.
  - ③ For each predicted toxicity type, a QSAR class<sup>\*2</sup> corresponding to the structure class is assigned (multiple classes may be assigned).
  - ④ For each assigned QSAR class, the toxicity value is calculated using the QSAR equation<sup>\*3</sup>.
  - ⑤ The applicability domain is judged (log P judgement and structure judgement).

- \*1 Refer to “Section 3.5 Structure class extraction”.
- \*2 Classification defined based on the structure of the chemical for each predicted toxicity type.
- \*3 Model built based on training set data included in the QSAR class. Here, a simple regression equation with log P as a descriptor.

### III. Prediction Output

If the query chemical cannot be assigned to any of QSAR classes for a predicted toxicity type, it is assigned to the unclassified class.

By default, the unclassified class and QSAR classes that do not satisfy statistical criteria ( $R^2 \geq 0.7$ ,  $Q^2 \geq 0.5$  and  $n \geq 5$ )\*<sup>4</sup> are not shown.

- \*4  $R^2$ ,  $Q^2$ , and  $n$  are the coefficient of determination, the robustness (Leave-one-out method), and the number of data points in the training set, respectively, and they are calculated beforehand for each QSAR class.

As an actual example, Fig. 3–2 shows the prediction flow of the chemical substance 1-pyridin-3-ylethanone.

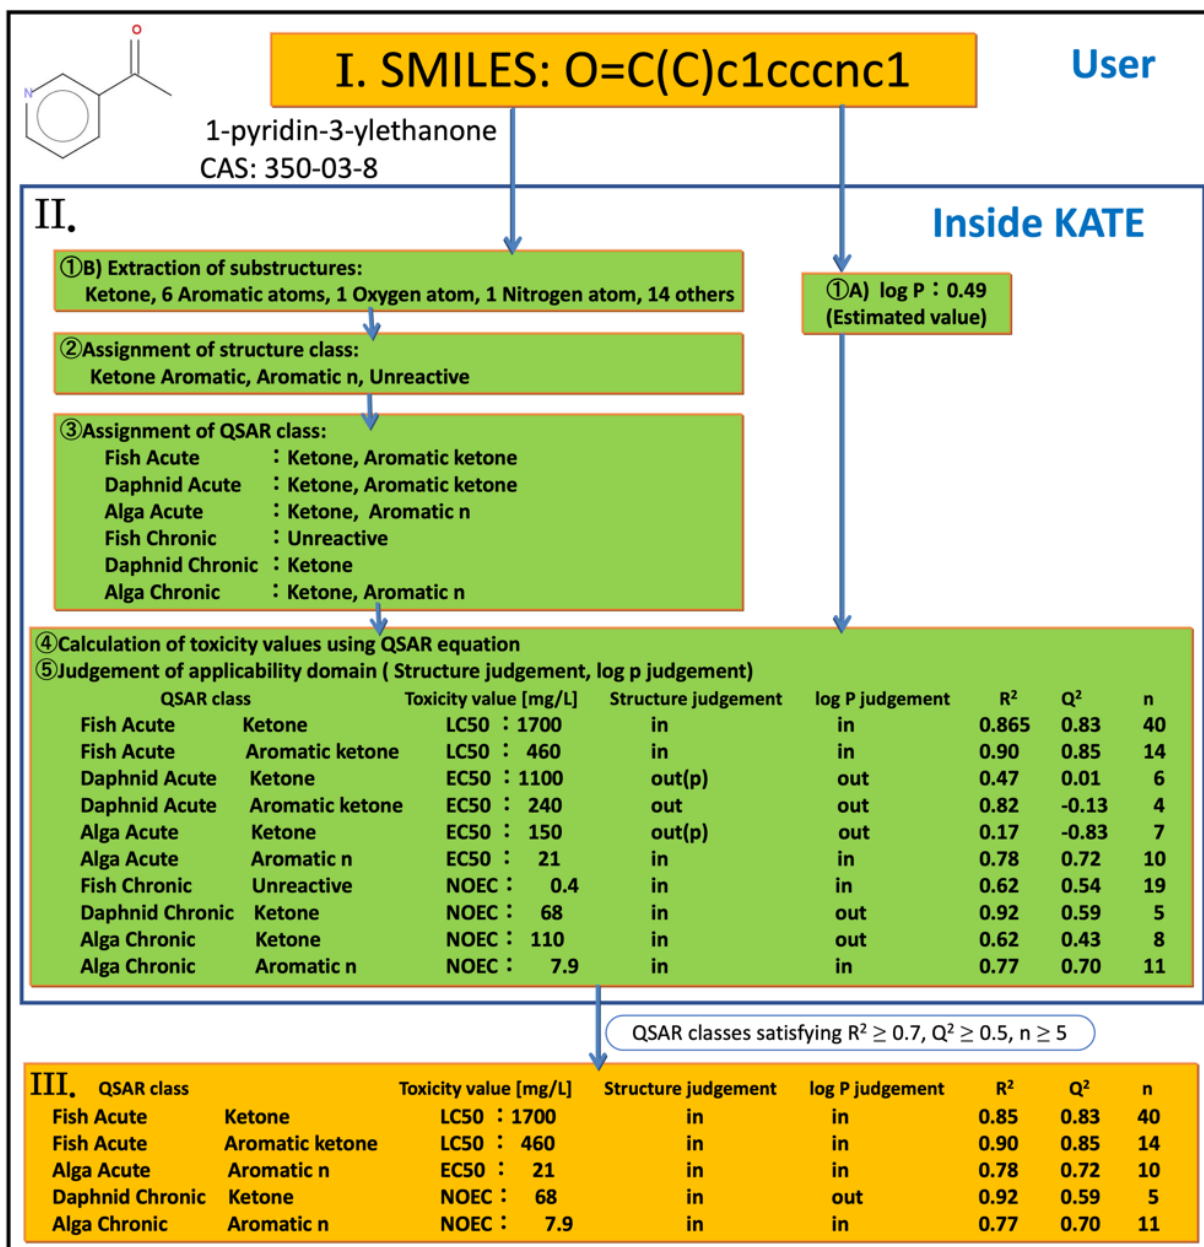

Figure 3–2: KATE2020 QSAR prediction flow (example)

※ The actual names of the Ketone, Aromatic ketone, Aromatic n and Unreactive in Figure 3–2 used in KATE2020 are as follows.

Ketone: COns\_X ketone unreactive

Aromatic Ketone: COS\_X ketone unreactive aromatic

Aromatic n: CNOS\_X aromatic n unreactive

Unreactive: CNO\_X unreactive Fish chronic, w/ N,O

In the following, we explain the flow of toxicity predictions in KATE2020.

### 3.2 Input of Chemical Substance(s)

The user either inputs SMILES directly, or converts a drawn structural formula, the CAS number, or the substance name to SMILES.

### 3.3 Obtaining log P Values

The log P value for the query chemical used to calculate the predicted toxicity value is determined by the following order of priority.

- 1.log P value entered by user (when user enters a value)
- 2.log P predicted value (when no value is entered by user)

KOWWIN<sup>TM</sup>[2], licensed by the U.S. EPA, is used to estimate the log P value (refer to Chapter 1, Section 1.6).

### 3.4 Extraction of Substructures

The number of substructures contained in the query chemical is calculated based on the substructure definition list (Table 3–2). Each row defines a single substructure in terms of SMARTS notation (Table 3–3).

Table 3–2: Substructure list (partial)

Substructure ID	Substructure Name	SMARTS
		...
3031	Ketone	<chem>[*6]([*8])([*6])[*6]</chem>
3032	Ester	<chem>[*6]([*6])([*8])([*6])[*8][*6];![*6]([*8])([*6])[*8][*6]=[O,S,N]</chem>
3033	Carbonate	<chem>[*6]([*6])([*8])([*8][*6])[*8][*6]</chem>
		...

Refer to the following link for a list of all substructures.

<https://kate.nies.go.jp/nies/substructures.php>

The CDK library[1] is used to calculate the number of substructures using SMARTS.

Table 3–3: List of substructures contained in substance to be predicted  
(SMILES: Case of O=C(C)c1ccnc1)

Substructure ID	Substructure Name	SMARTS	Count
3001	elements other than CX	[!#6;!#9;!#17;!#35;!#53]	2
3002	elements other than CNX	[!#6;!#7;!#9;!#17;!#35;!#53]	1
3003	elements other than COX	[!#6;!#8;!#9;!#17;!#35;!#53]	1
3004	elements other than CSX	[!#6;!#16;!#9;!#17;!#35;!#53]	2
3009	elements other than COSX	[!#6;!#8;!#16;!#9;!#17;!#35;!#53]	1
3014	elements other than CnosX	[\$(!#6;!F;!Cl;!Br;!I;!n;!s;!o),\$(n+)]	1
3022	Carbon	[#6]	7
3030	carbonyl C=O	[#6;\$([#6](=[#8]))]	1
3031	ketone CC(=O)C	[#6;\$([#6](=[#8])([#6])[#6])]	1
3059	C=O w/o electron donated o-, p-Nv3X3	[C;\$C(=O);!\$(C(=O)c1c([Nv3X3])ccc1);!\$(C(=O)c1ccc([Nv3X3])cc1)]	1
4504	>C=O or >C=S (sPilot4)	[CX3]=[OX1,SX1]	1
4543	MF: not C,c,O,F	[!C;!c;!O;!F]	1
4892	MF: not CHO (kPilotO)	[!C;!c;!O]	1
4893	MF: not CHOP	[!C;!c;!O;!P]	1
4910	aromatic	[a]	6
4911	aromatic n	[n]	1
5007	Nitrogen [N,n]	[#7]	1
5008	Oxygen [O,o]	[#8]	1

Substructure ID's beginning with "5" indicate substructures that are also used for structure judgement (Refer to Chapter 4, Section 4.1 A, Structure Applicability Domain).

### 3.5 Assignment of Structure Class

Based on the structure class definition (Figure 3-3 shows the structure class definition for ketone as an example), assign a structure class that matches the query substance. For example, O=C(C)c1ccnc1 has one or more substructure 3031 from Table 3-3 but does not match the conditions for R\_00001 (with any of substructures 3036, 3053, 3054, 3055, 3056, 3174, 4515, 4791, 6112) and G1\_00010 (with one of the substructures 3034, 4760), so it is determined to be ketone unreactive. And as it does not have substructure 3011, it is assigned a structure class of G1\_21025. In total, four structure classes are assigned for this predicted substance, as shown in Table 3-4.

Structure ID	Description	Decision tree
-	ketone CC(=O)C	ID:3031 > 0
-	ketone reactive	R_00001 = true
G1_21028	CNO_X ketone reactive	L ID:3006 = 0
G1_42027	CNO_X aldehyde, ketone	L ID:3173 > 0
-	ketone unreactive	L R_00001 = false and G1_00010 = false

Figure 3–4 Definition of structure class R\_00001 and G1\_00010

Table 3–4: Structure classes matching with query chemical (partial)  
(in the case of SMILES: O=C (C) c1cccnc1)

Structure class ID	Category	Structure class name
G1_21025	Ketone	COns_X ketone unreactive
G1_21029	Ketone	COS_X ketone unreactive aromatic
G1_25002	Hydrocarbon	CNO_X unreactive Fish Chronic, w/ N,O
GA_22075	aromatic n	aromatic n reactive Alga

The first letter/s (and in one case a combination of letter and number) in each structure class ID refers to the following structural types.

- Beginning with A: Acidic structure
- Beginning with C: Carbon-containing structure
- Beginning with R: Reactive structure
- Beginning with U: Unreactive structure
- Beginning with GF: Structure set as QSAR class related to fish
- Beginning with GD: Structure set as QSAR class related to daphnids
- Beginning with GA: Structure set as QSAR class related to alga
- Beginning with GFD: Structure set as QSAR class related to fish and daphnids
- Beginning with G1: Structure set as QSAR class related to one of either fish, daphnids, or alga

### 3.6 Assignment of QSAR Class

Based on the structural classes contained in the query substance, a corresponding QSAR class is assigned to each predicted toxicity type (Table 3-5).

- \* A single substance can be assigned multiple QSAR classes for a particular predicted toxicity type. The substance is regarded as unclassified if it cannot be categorized under any QSAR class.

Refer to the following link for a list of all QSAR classes.

[https://kate.nies.go.jp/nies/qsar\\_classes.php](https://kate.nies.go.jp/nies/qsar_classes.php)

Table 3–5: QSAR class list for assigning to substance to be predicted  
(in case of SMILES: O=C(C)c1cccnc1)

QSAR ID	QSAR class	predicted toxicity type	structure class ID
12102541	COns_X ketone unreactive	Fish Acute	G1_21025
12102941	COS_X ketone unreactive aromatic fish	Fish Acute	G1_21029
22102541	COns_X ketone unreactive	Daphnid Acute	G1_21025
22102941	COS_X ketone unreactive aromatic	Daphnid Acute	G1_21029
32102541	COS_X ketone unreactive	Alga Acute	G1_21025
32207541	aromatic n reactive Alga	Alga Acute	GA_22075
12500251	CNO_X unreactive Fish Chronic, w/ N,O	Fish Chronic	G1_25002
22102551	COns_X ketone unreactive	Daphnid Acute	G1_21025
32102551	COns_X ketone unreactive	Alga Chronic	G1_21025
32207551	aromatic n reactive Alga	Alga Chronic	GA_22075

The prefix of each QSAR class name in Table 3–5, such as COS\_X, shows which elements may be in substances of this QSAR class. Upper case alphabet signifies both aliphatic and aromatic, while lower case alphabet signifies only aromatic. For example, COS\_X means that both aliphatic and aromatic carbon, oxygen, sulfur, and halogens can be included, while CXnos means that aliphatic and aromatic carbon and halogens, and aromatic nitrogen, oxygen, and sulfur may be included. Therefore, substances containing aliphatic nitrogen are not classified as QSAR classes beginning with COS\_X or CXnos.

QSAR IDs (QSAR class ID) are following the rules below.

- The ID consists of 8 digits.
- The first digit is 1 for fish 2 for daphnid, and 3 for algae.
- The second to sixth digits match the last five digits of the structure class ID.
- The seventh digit is 4 for acute and 5 for chronic.
- The eighth digit indicates the descriptor. Only 1: log P is used at present.

Figure 3–5 shows a simplified flow from substructure extraction to QSAR class assignment when the SMILES of the query chemical is O=C(C)c1cccnc1.

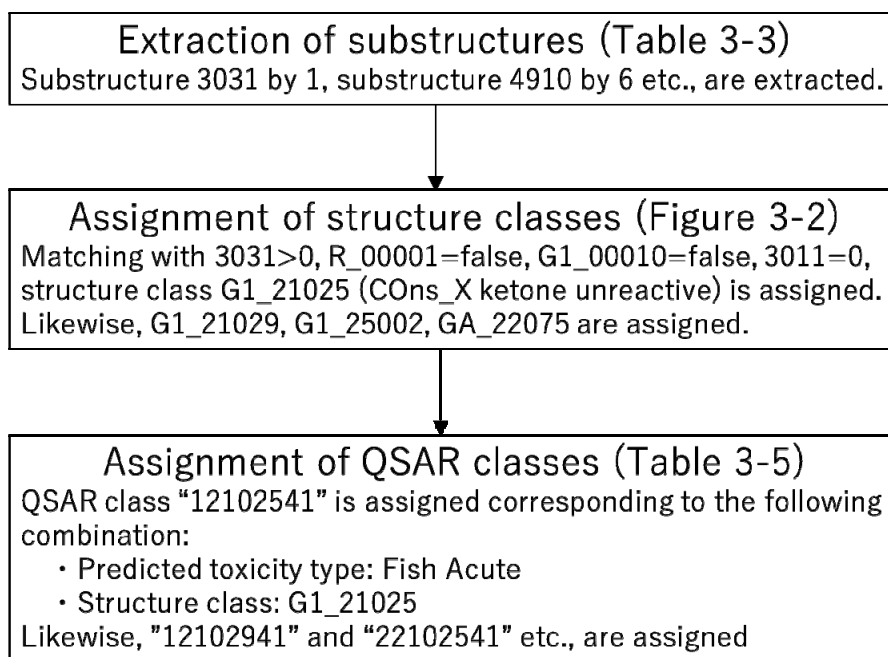

Figure 3–5: Flow from calculating the number of substructures to QSAR class assignment  
(in case of SMILES: O=C (C) c1cccnc1)

### 3.7 Calculation of Toxicity Value Using QSAR Equation

For each assigned QSAR class, log P of the query chemical and the precalculated slope and intercept of the relevant QSAR class\* (Table 3–6) are entered into the following QSAR equation to calculate log (1/toxicity value[mmol/L]). Then, the molecular weight\* of the query chemical is employed to convert to units of toxicity value[mg/L].

$$\log (1/\text{toxicity value}[\text{mmol/L}]) = \text{slope} \times \log P + \text{intercept} \quad \dots (1)$$

\* Open Babel [15] is used to calculate the molecular weight of the query chemical.

### 3.8 Calculation of Prediction Interval (reference information)

For each assigned QSAR class, substituting the x (log P) value of the query chemical and the statistical value  $t_{95, n, \sqrt{V_{\hat{x}}}, \Sigma^{-1}}$  (Tables 3–6, 3–7) calculated beforehand for the applicable QSAR class gives a 95% confidence level prediction interval for log (1/toxicity value[mmol/L]) defined below. Subsequently, using the

molecular weight of the query chemical, the lower and upper limits of the prediction interval of Equation (2) are converted into toxicity values [mg/L].

$$95\% \text{ predicted interval} = [\log (1/\text{toxicity value}[\text{mmol/L}]) - dy, \log (1/\text{toxicity value}[\text{mmol/L}]) + dy] \quad \dots (2)$$

Here,

$$dy = t_{95} \quad \dots (3)$$

$$D^2 = (x - \bar{x})^T \Sigma^{-1} (x - \bar{x}) \quad \dots (4)$$

Table 3–6: Statistical values needed for calculation of predicted intervals

Variable	Explanation	Formula
$n$	Number of data used in regression for the relevant QSAR class	
$\bar{x}$	Average descriptor value for the data used in regression for the relevant QSAR class	$\frac{\sum x_i}{n}$ $x_i$ : log P value of the $i$ -th training set data
$\Sigma^{-1}$	Inverse of the covariance matrix of the descriptors (Here, the inverse of the variance due to simple regression)	$\frac{n}{\sum (x_i - \bar{x})^2}$ $x_i$ : log P value of the $i$ -th training set data $\bar{x}$ : Mean value of log P of training set data
$V_e$	Residual variance	$\frac{\sum (y_i - \hat{y}_i)^2}{(n - p - 1)}$ $y_i$ : Measured toxicity value of the $i$ -th training set data $\hat{y}_i$ : Predicted toxicity value for the $i$ -th training set data $p$ : Number of descriptors (here 1 since it is a single regression)
$t_{95}$	t-value at 5% significance level (two-tailed test) for the degrees of freedom of the QSAR class	

Table 3–7: Example of statistical values needed for calculating QSAR equation slope, intercept, and prediction interval

QSAR ID	slope	intercept	$n$	$\bar{x}$	$\Sigma^{-1}$	$V_e$	$t_{95}$
12100241	0.847	-1.270	30	2.188	0.618	0.178	2.05
12101741	0.784	-1.397	25	2.803	0.963	0.033	2.07

### 3.9 Calculation of Similarity (reference information)

The degree of similarity of the substance to be predicted is calculated using a fingerprint\* (here, the Tanimoto Coefficient using the PubChem fingerprint [24]) for each substance (training data set and support chemicals) assigned to a QSAR class. Degree of similarity is not required information for predictions but can be used as reference information. The fingerprints for all substances included in KATE2025 are calculated beforehand.

The degree of similarity  $T$  between bitstream X (fingerprint of chemical included in QSAR class) and bitstream Y (fingerprint of the query chemical) is calculated using the formula below.

$$T = N_c / (N_x + N_y - N_c) \quad \dots (5)$$

Here,

$N_x$ : Bit count of 1 in X

$N_y$ : Bit count of 1 in Y

$N_c$ : Bit count of 1 common to X and Y

The numerical value is between 0 and 1, and the closer the value is to 1, the more similar the substance is to be predicted. Figure 3-6 illustrates the similarity calculation

\*A fixed length bitstream represents chemical substance data, each bit expresses the presence or absence of a particular feature of the chemical substance: 1 means the chemical substance features the property designated by that bit, while 0 means it does not possess that property.

Example of a fingerprint notation:

1001001000000000110010110000101010000110

Fingerprint X: 

0	0	0	1	1	1	0	0	1
---	---	---	---	---	---	---	---	---

Fingerprint Y: 

0	1	0	1	1	0	1	0	1
---	---	---	---	---	---	---	---	---

Number of 

: 6      Number of 

1
1

: 3

$$\text{Similarity (Tanimoto Coefficient)} = 3 / (4+5-3) = 0.5$$

Figure 3-6: Image of similarity (Tanimoto coefficient) calculation

The similarity can be verified using the QSAR class detailed view screen (Verify QSAR screen). Please refer to the KATE20255 Operating Manual† [6. QSAR Class Information Detailed View (Verify QSAR screen)] for more information regarding the Verify QSAR screen.

#### 4. Definition of Applicability Domain – OECD (Q) SAR Validation Principle 3

Here, we explain the applicability domain of the KATE2025 QSAR model and the method for determining the applicability domain.

##### 4.1 Applicability Domain

The applicability domain of KATE2025 is described in terms of A) structure applicability domain and B) log P applicability domain.

###### A) Applicability domain for structure

The applicability domain for structure is set for each QSAR class and substructures are assigned based on the list of substructures for structure judgement (Table 4–1) for training set data and chemical data with inequality sign (log P judgement for the applicable QSAR class (explained in 4.2 B) is within the applicability domain only).

Table 4–1: List of substructures for structure judgement for each QSAR class (partial)

QSAR ID	List of Substructures for structure judgement
	...
12100241	5004,5007,5008,5016,5022,5023,5028,5081,5500
22100741	5074, 5075
32100541	5020,5021,5067,5155
	...

Please refer to the following link for the substructure list used in structure judgement.

[https://kate.nies.go.jp/data/Substructures\\_for\\_judgement.html](https://kate.nies.go.jp/data/Substructures_for_judgement.html)

## B) Applicability domain for log P

The following log P ranges (Table 4–2) for each QSAR class are calculated beforehand in order to judge log P (explained in 4.2 B).

- log P range 1: log P minimum value and maximum value of training set data included in the applicable QSAR class (needed for the judgement of “in” and “out”)
- log P range 2: log P minimum value and maximum value of training set data and chemical data with inequality sign included in the applicable QSAR class (needed for the judgement of “out(p)”)

The applicability domain of log P is given based on the log P range 1.

Table 4–2: log P range for each QSAR class

QSAR ID	log P Range 1	log P Range 2
...		
12100241	0.09 ~ 4.84	0.09 ~ 4.84
22100741	3.77 ~ 6.17	3.77 ~ 6.89
32100541	1.46 ~ 3.48	1.46 ~ 4.63
...		

## 4.2 Applicability Domain Judgement Method

KATE2025 judges whether the predicted toxicity value of the query chemical falls within the applicability domain. Judgement by A) structure and by B) log P are conducted and if both are within the applicability domains, the predicted toxicity value is judged to be within the applicability domain.

### A) Structural Judgement

KATE2025 compares substructures used for structure judgement to judge whether the structure of a query substance is within the applicability domain of the relevant QSAR class (Figure 4–1). There are three possible results as explained below. Structures judged to be within the applicability domain of a particular QSAR class are classified as either “in” or “in(p).”

- in: Within applicability domain

When all substructures for structure judgement contained in the query chemical are included in the substructure list (refer to Table 4–1) for structure judgement of substances\*1 in the applicable QSAR class (pink

area of Figure 4–1), or when the query chemical possesses none of the substructures for structure judgement.

- in(p): Provisionally within applicability domain

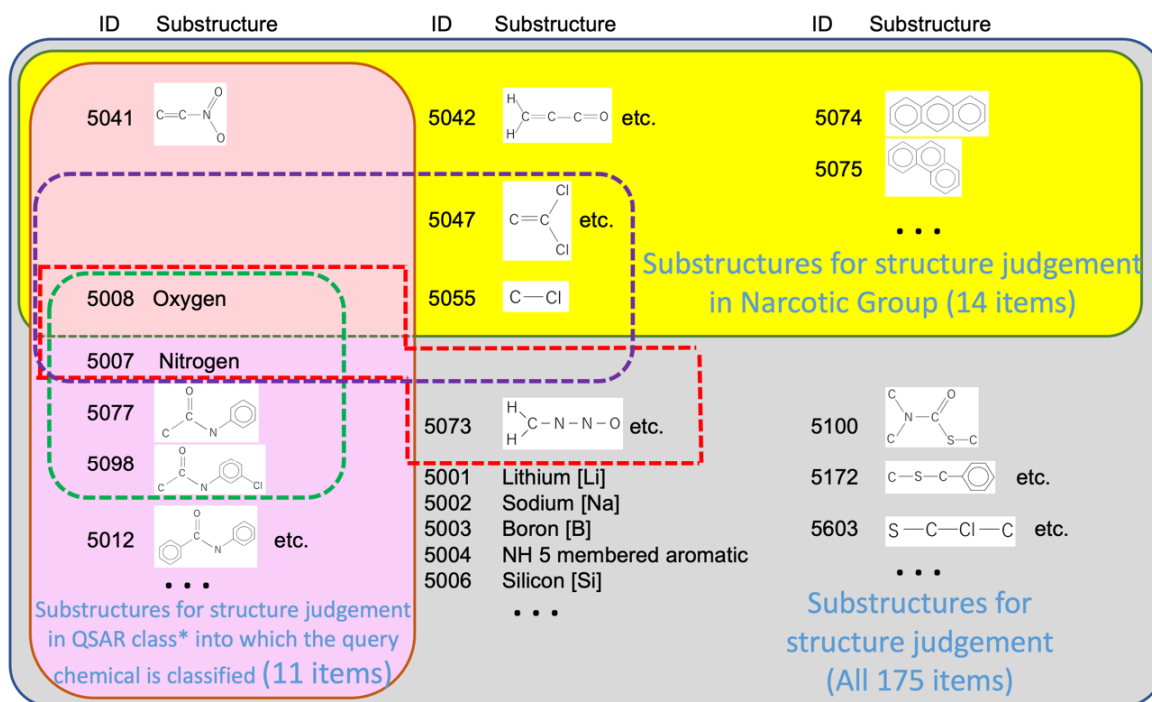

While not satisfying the conditions for “in,” all substructures for structure judgement for the substance to be predicted are either included in the substructure list for structure judgement for the applicable QSAR class or included in the substructure list for structure judgement <sup>\*1</sup> of Narcotic Group<sup>\*2</sup> (pink and yellow areas of Figure 4–1).

- out : Out of applicability domain

Cases where the conditions for neither “in” nor “in (conditionally)” are satisfied. In other words, when the query chemical possesses substructures for structure judgement that are neither included in the substructure list for structure judgement for the applicable QSAR class, nor included in the Narcotic Group<sup>\*2</sup> class (structures in the gray area of Figure 4–1).

\*1 Here, data with inequality signs whose log P judgement is “in” (within the applicability domain ) are included.

\*2 Low reactivity, and baseline toxicity (narcotic effect) not based on a specific bioactivity. QSAR classes containing chemicals such as aliphatic hydrocarbons, sulfoxides, aliphatic and aromatic esters, aliphatic and aromatic ketones, and alcohols, whose toxicity can be explained by simple narcotic effect, exist for each predicted toxicity type. Narcotic group class is defined to include such QSAR classes.

Examples of Query Chemical

Structure Judgement

in

in(p)

out

\*QSAR Class Name : CNO\_X amide unreactive, Type of toxicity: Fish Acute

Figure 4-1: Structural judgement example

## B) log P Judgement

KATE2025 judges whether the log P value of the query chemical falls between the log P minimum value and maximum value (the range shown in Table 4–2 for the applicable QSAR class) for all training data set (support chemicals data is not included) for the applicable QSAR class in order to judge whether the value falls within the applicability domain. Note that all substances with log P>6.0\* are judged as out of the applicability domain for KATE2025 (a modification in KATE2020 version).

\* The threshold value of 6.0 set here was selected based on a comprehensive consideration of the following: the cut-off value for predicted acute toxicity in ECOSAR is 5.0 (some set at 6.4); the cut-off value for predicted chronic toxicity value is set at 8.0; the upper limit of linearity between log P and log BCF (for example, in Dimitrov et al. SAR QSAR Environ Res., 13, 177-184, 2010, the upper limit is 6.1–6.5); and the upper limit of the applicability domain for measurement of log P for highly hydrophobic (log P>4) substances using the HPLC method (prescribed by OECD Test Guideline 117) is 6.

- in: Within applicability domain (refer to Figure 4–2).
- out: Outside applicability domain. Excluding the case of “out of+” explained in the following (refer to Figure 4–3).
- out(p): Outside applicability domain. However, the log P value of the query chemical lies between the log P minimum value and maximum value (log P range 2 for each QSAR class row in Table 4–2) for all substances including the training data set and support chemicals for the applicable QSAR class (refer to Figure 4–4).

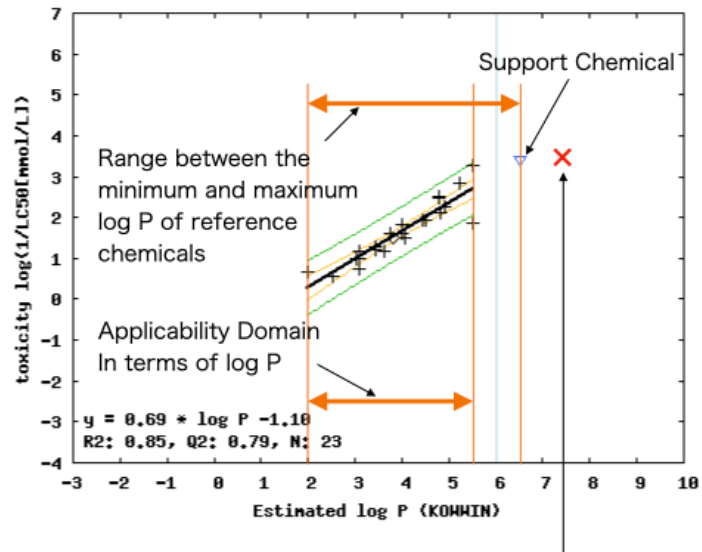

Figure 4–2: log P judgement example “in”

log P of the query chemical : 7.5 Judgement : out

Figure 4-3: log P judgement example of "out"

log P of the query chemical : 5.8 Judgement : out(p)

Figure 4-4: log P judgement example of "out(p)"

## 5. Validation – OECD (Q) SAR Validation Principle 4

### 5.1 Internal Validation

Here, the goodness-of-fit (to what extent the model explains responses in training set data, in other words, variances of predicted toxicity values) and robustness (the stability of predictions if one or more data is removed from a training set) of KATE2025 QSAR models are evaluated.

#### 5.1.1 Indicators used for internal validation

Internal validation uses the indicators listed in Table 5–1.

Table 5–1: Internal validation indicators

indicator	Explanation
$R^2$	<p>An index of goodness of fit (coefficient of determination), taking a value between 0 and 1, the closer to 1, the better the fit.</p> $R^2 = 1 - \frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{\sum_{i=1}^n (y_i - \bar{y})^2}$ <p> <math>y_i</math> : Measured toxicity value of the <math>i</math>-th training set data  <math>\hat{y}_i</math> : Predicted toxicity value of the <math>i</math>-th training set data  <math>\bar{y}</math> : Average of measured toxicity values of training set data  <math>n</math> : Number of training set data                 </p>
$Q^2$	<p>Robustness index (leave-one-out method); the closer it is to 1, the more robust it is, and it can be negative.</p> $Q^2 = 1 - \frac{\sum_{i=1}^n (y_i - \hat{y}_{i,-i})^2}{\sum_{i=1}^n (y_i - \bar{y})^2}$ <p> <math>y_i</math> : Measured toxicity value of the <math>i</math>-th training set data  <math>\hat{y}_{i,-i}</math> : Predicted toxicity values from regression equations constructed with the remaining training data, excluding the <math>i</math>-th training set data  <math>\bar{y}</math> : Average of measured toxicity values of training set data  <math>n</math> : Number of training set data                 </p>

#### 5.1.2 Internal validation results

Table 5–2 shows the internal validation results for QSAR classes that meet statistical criteria ( $R^2 \geq 0.7$ ,  $Q^2 \geq 0.5$  and  $n \geq 5$ ) [25–30].

Table 5–2: List of QSAR classes meeting statistical criteria  
(sorted by *n* value for each organism and acute/chronic)

QSAR Class	Organism	Acute/ Chronic	$R^2$	$Q^2$	<i>n</i>

## 5.2 External Validation

Here, external predictivity performance (how well can new data that was not used in model development be predicted) of KATE2025 are explained.

### 5.2.1 Data (test set) used in external validation

Toxicity values listed in OECD SIDS (Screening Information DataSet) were used as the test set for external validation. Data deviating from the standard test duration of  $\pm 24$  hours and data with reliability (Klimisch code) of 3 or 4 were excluded, while test results for species not included in KATE2025 (e.g., *Danio rerio* and *Desmodesmus subspicatus*) were adopted. Further, if multiple test results existed for a single substance, the data of highest reliability was adopted. If multiple test results with the highest reliability existed, the geometric mean value of those data was taken.

Table 5–3 shows the number of test set substances for each predicted toxicity type and the data where predicted toxicity values were obtained within applicability domain of KATE2025. If more than one predicted toxicity values were obtained for one chemical per predicted toxicity type, only one predicted value closest to measured toxicity value was used.

Table 5–3: Test set data points

	Acute			Chronic		
	Fish	Daphnid	Alga	Fish	Daphnid	Alga
Number of Chemicals	178	196	141	3	46	100
Number of Predicted Toxicity Values within applicability domain	114	117	66	1	32	45

## 5.2.2 Results

Of the data of Table 5–3, Table 5–4 shows the number and ratio of data points within the applicability domain (including “in (conditionally)” structure judgement) where the ratio of predicted value to measured value is less than one order of magnitude (1/10<sup>th</sup> to 10 times) and less than two order of magnitude (1/100<sup>th</sup> to 100 times) for all QSAR classes. The data is also present in graph form in Figure 5–1. In the figure, inside the blue dotted line is the range of one order of magnitude, and the red single-pointed line the two order of magnitude.

Table 5–4: Number and ratio of data points where ratio of predicted to measured value is less than one order and two order of magnitude for all QSAR classes

	Acute						Chronic					
	Fish		Daphnid		Alga		Fish		Daphnid		Alga	
	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio
Data falling within 1 order of magnitude	102	89%	96	82%	48	73%	0	0%	25	78%	33	73%
Data falling within 2 order of magnitude	112	98%	114	97%	64	97%	1	100%	31	97%	42	93%
All data within AD	114		117		66		1		32		45	

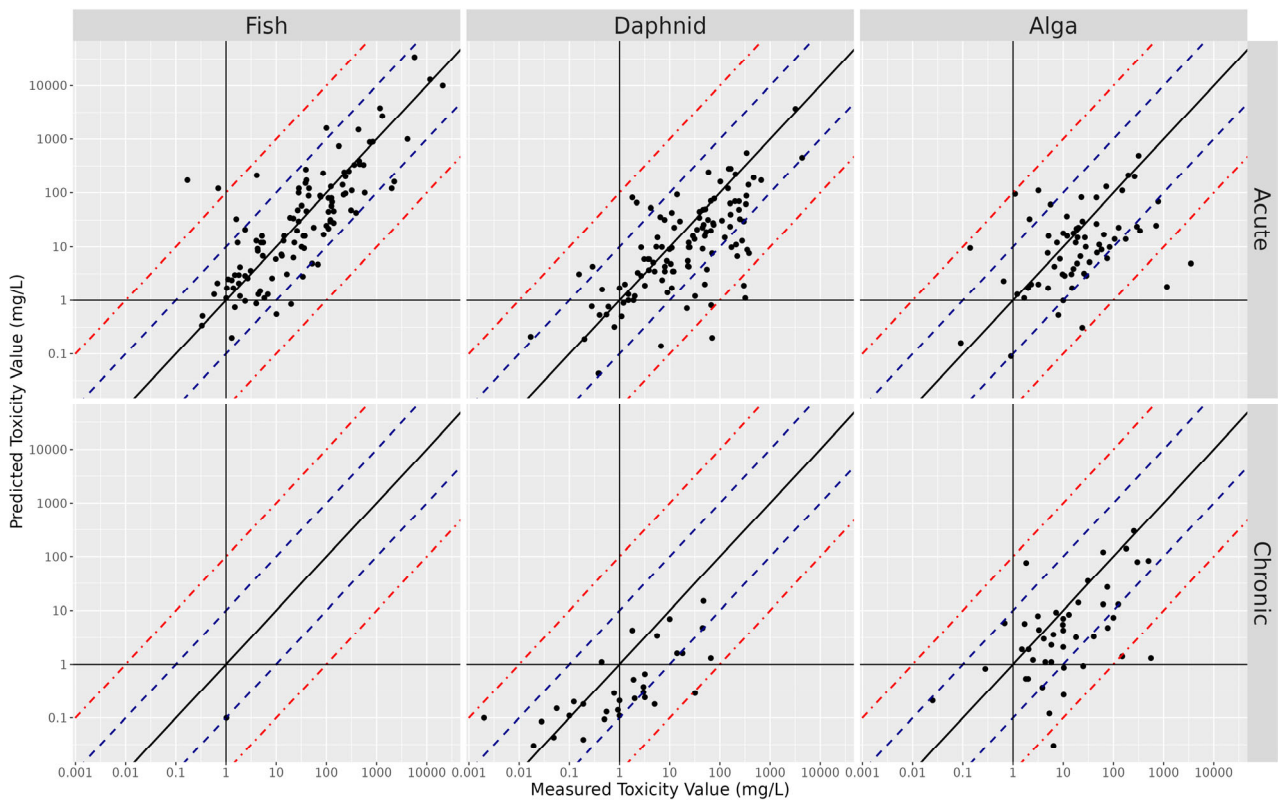

Figure 5–1: Predicted versus measured values for all QSAR classes

The number and ratio of data points assigned to QSAR classes that satisfy statistical standards (Table 5–2) that are within the applicability domain (log P judgement and structure judgement are both “in,” including “in (conditionally)” structure judgement) where the ratio of predicted value to measured value is less than one order of magnitude and two order of magnitude for QSAR classes that satisfy statistical criteria are shown in Table 5–5 and graphically represented in Figure 5–2.

Table 5–5: Number and ratio of data points where ratio of predicted to measured value is less than one order and two order of magnitude for QSAR classes satisfying statistical criteria

	Acute						Chronic					
	Fish		Daphnid		Alga		Fish		Daphnid		Alga	
	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio	Number	Ratio
Data falling within 1 order of magnitude	78	92%	49	82%	15	68%	0	NA	9	90%	9	69%
Data falling within 2 order of magnitude	83	98%	58	97%	22	100%	0	NA	10	100%	12	92%
All data within AD	85		60		22				10		13	

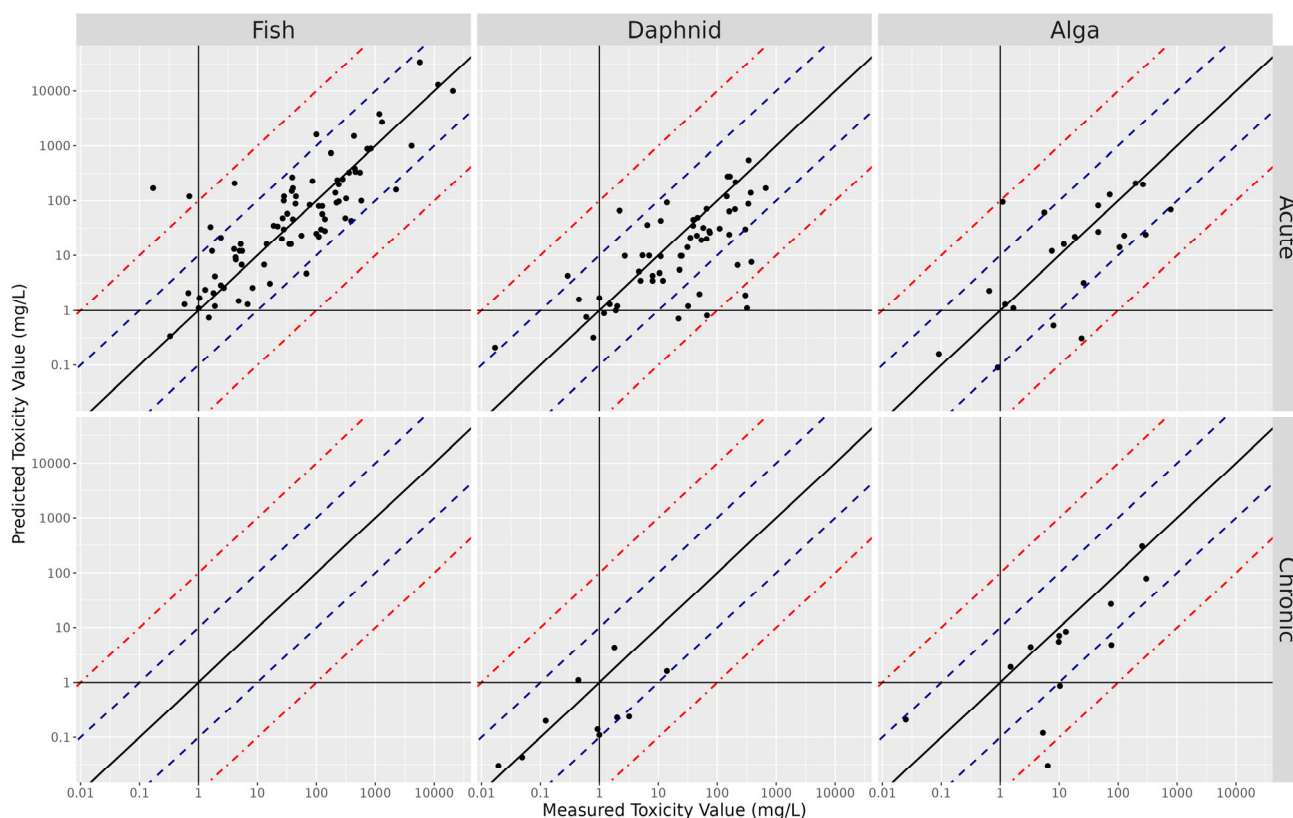

Figure 5–2: Predicted values versus measured values for QSAR classes satisfying statistical criteria

## 6. Interpretation of mechanism – OECD (Q) SAR Validation Principle 5

A linear relationship between the logarithms of hydrophilicity (membrane permeability) and toxicity has been reported[31], and KATE2025 constructs QSAR equations based on log P as an explanatory variable and toxicity value (effective concentration) as a dependent variable. Each QSAR class in KATE205 consists of chemical substances that possess characteristic structures, and each structure class is defined by the parameter for number of substructures (Chapter 3, Section 3.5). Substances possessing substructures considered to be highly reactive are classified as reactive structure classes and are believed to exhibit toxicity through their nonspecific high reactivity. Substances without such substructure are considered to have low reactivity and are classified as unreactive structure classes[32]. Some structure classes contain substructures that act via specific mechanisms. Please refer to the following for structure classes and substructure list.

Structure class list: [https://kate.nies.go.jp/nies/structure\\_classes.php](https://kate.nies.go.jp/nies/structure_classes.php)

Substructure class list: <https://kate.nies.go.jp/nies/substructures.php>
